Note: Data presented in this table supersede 1976 published data. Data were revised as a result of adjustments to estimating technique. For a complete discussion of these adjustments, see appendix G, Method of Estimation.

- Represents zero. (D) Withheld to avoid disclosing operations of individual companies. (S) Withheld because the estimate did not meet publication standards, either on the basis of the associated standard error of the estimate or on the basis of a consistency review. (X) Not applicable. (Z) Less than half of the unit of measure specified.

[1]Standard error of estimate is described in appendix B. Cost of fuels (col. D) and purchased electric energy (col. Q and R) were collected from all establishments in the 1977 Census of Manufactures. The figures shown for these items are census totals; therefore, sampling errors do not apply. Standard errors of estimates for the cost of coke for the standard metropolitan statistical areas that reported this fuel and standard errors of estimates for "other fuels" are not shown in this table. Standard errors for "other fuels" are generally higher, and may sometimes be considerably higher than those for specified kinds of fuels for which standard errors of estimates are shown. Standard error for cost of coke consumed is less than 1 percent at "all industries" level.

Gross Book Value of Depreciable Assets
Capital Expenditures
Retirements
Depreciation
Rental Payments

CAPITAL EXPENDITURES FOR NEW MACHINERY AND EQUIPMENT BY TYPE

4. Industry Groups and Industries: 1977 34
5. States: 1977 44

EXPLANATORY TEXT

SUMMARY DATA

At the beginning of 1977, gross book value of depreciable assets held by all operating manufacturing establishments was estimated to be $402.1 billion. By the end of the year 1977, the total rose to $439.0 billion as a result of $51.9 billion in capital expenditures for new and used buildings and equipment during the year, which were offset by $15.0 billion retirements during 1977.

Capital expenditures (new and used) totaled $51.9 billion for 1977, with $48.6 billion for new and $3.3 billion for used buildings and equipment. Of the total figure for expenditures for new buildings and equipment, establishments classified in the chemicals and allied products (SIC 28) industry group accounted for $8.2 billion, establishments classified in the transportation equipment (SIC 37) industry group accounted for $4.7 billion, and establishments classified in the primary metal (SIC 33) industry group accounted for $4.5 billion.

The States with the largest expenditures for new buildings and equipment were Texas, Michigan, and California. These States accounted for nearly 26 percent of the total.

Retirements of depreciable assets during 1977 amounted to $15.0 billion and were 4 percent of the beginning-of-year assets. Retirements of machinery and equipment accounted for 84 percent of this total retirement figure.

The gross book value of depreciable assets at end-of-year 1977 was $439.0 billion, with approximately 28 percent held by establishments classified in the chemical and allied products (SIC 28) and primary metal (SIC 33) industry groups. Establishments located in the States of California and Pennsylvania held approximately 14 percent of all manufacturers' assets.

In addition to the data on gross book value of depreciable assets, capital expenditures, and retirements, this report presents data on depreciation charges during 1977 and rental payments. For all manufacturing establishments, depreciation charges totalled $26.7 billion during 1977 and accounted for approximately 7 percent of the beginning-of-year gross book value of depreciable assets. Rental payments for buildings and equipment made by manufacturers amounted to $7.1 billion during 1977. Approximately 55 percent of these payments were for the use of machinery and equipment.

SOURCE

These data were collected from establishments included in the annual survey of manufactures (ASM) sample for 1977. (Please see the Introduction—Manufacturing Universe and Census Report Forms for a detailed discussion of the ASM and its relationship to the census. Appendix B discusses the estimating procedures used and sampling qualifications of the data.) In the 1977 Census of Manufactures, only establishments included in the ASM sample panel were requested to provide detailed information on gross book value of fixed depreciable assets, capital expenditures, retirements, depreciation charges, and rental payments for buildings and equipment. (A definition of each of these items may be found in appendix A.)

The ASM has been providing data on gross book value of assets in place and rental payments since 1967 and for capital expenditures for many more years. This report provides, for the first time, data on depreciation and retirements. This expansion took place to provide information needed to improve the Gross National Products (GNP) accounts and productivity measures. The expansion was strongly recommended in reports of the Advisory Committee to the Office of Federal Statistical Policy on GNP Data Improvement, and the National Resource Council of the National Academy of Science on Measurement and Interpretation of Productivity.

In the 1977 Census of Manufactures, expenditures for new and used buildings and equipment were also requested of establishments not included in the ASM, except for very small single establishment companies that were not sent any report form (see the Introduction—Manufacturing Universe and Census Report Forms). Universe estimates based on figures reported by establishments filing census reports (MA-100 or other forms) or estimated for the administrative record cases were previously published in the 1977 Census of Manufactures Industry and Area Series. These figures may differ from the results shown in this report, which are based on the ASM sample alone, because of sampling error. The data obtained from the complete census are considered more reliable estimates of the actual levels of capital expenditures. However, the ASM figures shown in this report are considered the best estimate of year-to-year change in capital expenditures (e.g., 1976 to 1977).

RELATIONSHIP TO BEA-SEC CAPITAL EXPENDITURES SERIES

The establishment-based census estimates of capital expenditures (both those derived from the ASM and from the census of manufactures universe) differ from those published by the Bureau of Economic Analysis (BEA) in its quarterly survey of plant and equipment expenditures. In addition to sampling variation (BEA survey is also a sample), there are differences due to use of two different reporting units. The Bureau of the Census data relate to manufacturing establishments only, whereas the BEA series is based on reports filed for company level operations which include nonmanufacturing as well as manufacturing. Also, the capital expenditures of manufacturing establishments owned by companies engaged primarily in nonmanufacturing activities are not classified as manufacturing in the BEA series. They are included in the Bureau of the Census figures for manufacturing. Both series, it should be noted, exclude expenditures for buildings and equipment at establishments owned by the Federal Government but operated under lease or contract by private companies.

Table 1. Manufacturers' Gross Book Value of Depreciable Assets, Capital Expenditures, Retirements, Depreciation Charges, and Rental Payments for Buildings and Machinery: 1977 and Earlier Years

(All figures in millions of dollars except where noted. For explanation of terms, see appendix A. For description of annual survey of manufactures and estimating procedures used, see appendix B)

(NA) Not available. (X) Not applicable.

[1]For all items shown, except new and used capital expenditures in the 1972, 1967, and 1963 census years, data are estimates based on a representative sample of establishments included in the annual survey of manufactures (ASM) and may differ from results of a complete canvass of all establishments. The ASM figures in this table represent the best estimates of the year-to-year change as measured by the continuing ASM sample. However, they are subject to sampling error and hence, as estimates of level, are not as reliable as universe figures.

Comparable ASM figures for new and used expenditures for 1972, 1967, and 1963 are not available. The data shown are the census universe figures based on information collected from manufacturers completing one of the census of manufactures forms, including the ASM form, or estimated for small single establishment companies that were not sent a report form. For 1977, census universe totals for total new capital expenditures, new building expenditures, new machinery expenditures, and total used expenditures have been published in table 3a of the 1977 Census of Manufactures, Industry Series, and also table 3a of the area series. For comparison purposes, the 1977 census universe figures are $47,459.0 million for total new expenditures and $2,870.4 for total used expenditures.

[2]Includes data for plants under construction and not yet in operation.

[3]Description of the standard error of estimate is given in appendix B under "Qualifications of the Data." The percentage standard errors shown are the approximate relative standard errors of the estimate level.

[4]The published end-of-year assets figure for 1976, as shown above, is not as reliable as the 1977 beginning-of-year assets figure also shown above. The 1977 figure has been adjusted upward to approximate a census universe figure (see appendix B) and includes revisions to establishment data originally reported by respondents in the 1976 ASM. Processing errors and sampling problems during the 5-year life of the ASM sample, are the main reasons for the upward adjustment of the beginning-of-year assets in a census year.

Table 2. Gross Book Value of Depreciable Assets, Capital Expenditures, Retirements, Depreciation Charges, and Rental Payments for Buildings and Machinery for Industry Groups and Industries: 1977

(All figures in millions of dollars except where noted. For explanation of terms, see appendix A. For description of annual survey of manufactures and estimating procedures used, see appendix B)

Figures in parentheses have standard errors of 15 percent or more. (S) Withheld because the estimate did not meet publication standards.

[1]For a description of the standard error of estimate, see the section "Qualifications of the Data" in appendix B.

[2]Total figures may differ slightly from sum of the individual States due to the inclusion of a few establishments at the United States total level that could not be accurately coded to a State.

Table 4. Capital Expenditures for New Machinery and Equipment by Type for Industry Groups and Industries: 1977

(All figures in millions of dollars except where noted. For explanation of terms, see appendix A. For description of annual survey of manufactures and estimating procedures used, see appendix B)

- Represents zero. (A) Indicates standard errors of 100 percent or more. (D) Withheld to avoid disclosing operations of individual companies. n.e.c. Not elsewhere classified. (S) Withheld because estimate did not meet publication standards. (Z) Less than 50 thousand dollars.

[1]This category represents the total machinery and equipment expenditures for establishments that did not provide a breakdown of their expenditures for the three specific categories.

[2]For a description of the standard error of estimate, see the section "Qualifications of the Data" in appendix B. Standard error of estimates are provided for industry totals. Any total figure in parentheses has a relative standard error of 15 percent or more. Relative standard error for detail items (column B, C, D, and E) are not shown. The relative standard error for a detail item will exceed the relative standard error for the total item and will approximate the standard error for the total item multiplied by the square of the ratio of the total to detail items.

Table 5. Capital Expenditures for New Machinery and Equipment by Type for States: 1977

(All figures in millions of dollars except where noted. For explanation of terms, see appendix A. For description of annual survey of manufactures and estimating procedures used, see appendix B)

State	Expenditures for new machinery and equipment					Standard error of estimate[2] (percent) for column--
	Total	Automobiles, trucks, etc. for highway use	Computers and peripheral data processing equipment	All other expenditures for new machinery and equipment	Expenditures for new machinery and equipment, n.s.k.[1]	
	A	B	C	D	E	A
United States[3]	40,035.9	1,219.8	866.8	32,378.7	5,570.4	1

[1]This category represents the total machinery and equipment expenditures for establishments that did not provide a breakdown of their expenditures for the three specific categories.

[2]For a description of the standard error of estimate, see the section "Qualifications of the Data" in appendix B. Standard error of estimates are provided for State totals. Any total figure in parentheses has a relative standard error of 15 percent or more. Relative standard errors for detail items (columns B, C, D, and E) are not shown. The relative standard error for a detail item will exceed the relative standard error for the total item and will approximate the standard error for the total item multiplied by the square of the ratio of the total to detail items.

[3]Total figures may differ slightly from sum of the individual States due to the inclusion of a few establishments at the United States total level that could not be accurately coded to a State.

1. Value of Inventories for Manufacturing and Distribution Sectors: 1977 and Earlier Years 3
2. Value of Manufacturers' Inventories for Industry Groups and Industries: End of 1977 and 1976 . . 4
3. Value of Manufacturers' Inventories for States: End of 1977 and 1976 12

EXPLANATORY TEXT

Data on beginning-of-year and end-of-year inventories held by manufacturing establishments were collected in the 1977 census. Separate inventory figures were requested for (1) finished products, (2) work in process, and (3) materials, supplies, fuel, and other inventories.

Respondents were asked to report their inventories at approximate current costs if feasible; otherwise, at book values. Since different methods of inventory valuation are used (LIFO, FIFO, etc.), the definition of the value of inventories aggregate for all establishments in an industry is not precise. The figures on change in inventory between the beginning and the end of the year are of considerably greater significance.

In using inventory data by stage of fabrication for all industries and at the 2-digit industry level, the following should be noted: An item treated as a finished product by an establishment in one industry may be reported as a raw material by another establishment in a different industry. For example, the finished product inventories of a steel mill would be reported as raw materials by a stamping plant. Such differences are present in the inventory figures by stage of fabrication shown for individual industries, industry groups, and all manufacturing which are merely aggregates of figures reported by establishments in specified industries. Further, the total finished-goods inventory for "all manufacturing" includes items that are not finished manufactured products.

For a few industries in the food group, there are special problems in the handling of inventories by stage of fabrication. These are industries in which the products are usually stored and aged under controlled conditions. Such types of products include stemmed and dried tobacco, cheese, and whiskey. It is not clear whether such products should be treated as finished goods, work in process, or material and supplies inventories while in storage. In the cheese and whiskey industries, substantial finished-goods inventories have been reported; while in the tobacco industries, the bulk of the inventories have been classified as materials and supplies. These data have been summarized in the inventory tables in a consistent manner for the years included in this report.

Data in this publication have been previously published in the separate reports comprising the 1977 Census of Manufactures Industry and Area Series (see Introduction). Slight differences may exist between the data in this report and the previously published data due to corrections made for minor errors identified after the industry and area reports were issued. This report reflects these corrections and specifically notes revisions of 3 percent or more.

In addition, differences will exist between end-of-year inventory data published in the 1976 Annual Survey of Manufactures reports and information in this report for 1976 end-of-year inventories. The main reason for these differences is the effect of industry shifts, discussed in the Introduction, along with the effects of sampling and processing errors and revisions to establishment data reported by the respondents.

Table 1. Value of Inventories for Manufacturing and Distribution Sectors: 1977 and Earlier Years

(Millions of dollars)

Sector	Value of inventories at end of--				
	1977	1972	1967	1963	1958

1. Statistics for Operating Manufacturing Establishments, by Type of Operation and Legal Form of Organization: 1977, 1972, 1967, 1963, 1958, 1954, and 1947. 3
2. Selected Statistics for Operating Manufacturing Establishments, by Type of Operation and Legal Form of Organization, for Major Industry Groups and Industries: 1977. 5

EXPLANATORY TEXT

Information concerning whether a plant is either independent or part of a multi-establishment company contributes importantly to our knowledge of the structure of manufactures in the United States. However, this classification is significantly affected by the way in which the census of manufactures is taken. In 1947, it was not taken in conjunction with the census of business or mineral industries and the multiunit classification depended on whether or not the company operated more than one manufacturing plant. In 1954 and since, the census of manufactures has been conducted in conjunction with the censuses of business and mineral industries, and so the multiunit classification now depends on whether or not the company operates at more than one location within the temporal spans of those censuses. Thus, in 1954 and subsequent census years, a company with one manufacturing plant and a nonmanufacturing location or separate administrative office was classified as multiunit.

While the importance of multiunit establishments, in terms of employment and value added, has increased since 1947 (see table 1), part of this increase is undoubtedly due to the change in collection procedures that took place between 1947 and 1954. However, during those years, this increase in employment and value added was accompanied by a decline in the percentage of establishments accounted for by multiunit companies. Part of this was due to the inclusion in the 1954 Census of Manufactures of industries characterized by a large number of small firms (e.g., milk distribution and logging) which account for a very small amount of the total manufacturing employment and value added. This shifting in the determination of single and multiunit establishments did not occur after the 1954 census, and the 1958 and subsequent data are completely comparable.

In 1963, each establishment was asked to report the form of organization of the company which operated it. In 1967, a separate category of establishments was created to account for single-unit manufacturing firms with less than 10 employees which were excused from filing reports. Information for most single-unit establishments with less than 10 employees in 1967 is contained in the "administrative record" classification. Thus, the relative importance of the single-unit classification can be determined by the combination of the categories, "single-unit companies," and "administrative records."

In 1972, the method for classifying multiunit and single-unit companies was the same as in 1967. However, "legal form of organization" data was not requested on the 1972 census report forms. They were, instead, compiled from administrative-record information obtained from other government agencies.

For 1977, data on legal form of organization was requested from those establishments that were sent a census report form. For small single-unit establishments which did not receive a form, the legal form of organization information was obtained from administrative records of other government agencies (see Introduction—Manufacturing Universe and Census Report Forms).

Data at the 4-digit SIC level (total line only) have been previously published in the separate reports comprising the 1977 Census of Manufactures Industry Series.

Table 1. Statistics for Operating Manufacturing Establishments, by Type of Operation and Legal Form of Organization: 1977, 1972, 1967, 1963, 1958, 1954, and 1947

(NA) Not available.

[1]The 1958 and 1963 figures include establishments classified in Industry 3273, Ready-Mixed Concrete, and establishments classified in Industry 3599, Miscellaneous Machinery, that were engaged exclusively or almost exclusively in machine shop repair work. The data for such establishments are excluded from the 1954 and 1947 figures. The 1963, 1958, and 1954 figures include data for establishments engaged in the processing and distribution of fluid milk, Industry Group 202, Dairies. These establishments were not included in the 1947 figures. In addition, the 1963 and 1954 census figures include data for logging camps and contractors, industry 2411, which were not included within the scope of the 1947 census. Data for Alaska and Hawaii, which are included for 1963, are not available on a type-of-operation and legal-form-of-organization basis for 1958 and earlier years.

[2]The figures for 1954, 1958, 1963, 1967, 1972, and 1977 include expenditures for plants under construction and not yet in operation. This information was not collected for 1947.

[3]All data are based on reports for individual manufacturing establishments, and not on a company basis. Each establishment of multiestablishment companies is classified by its primary industrial activity. For this reason, the statistics presented in this table cannot be compared directly with tabulations in which the whole corporation or company is the reporting unit and the entire company is classified in one industry--for example, "Statistics of Income, Corporation Income Tax Returns," compiled by the Bureau of Internal Revenue, U.S. Treasury Department. Since 1958, establishments were classified as part of a multiunit company when the company operated two establishments or more, of which at least one was a manufacturing establishment. In 1947, establishments were considered part of a multiunit only if the company operated two manufacturing establishments or more.

[4]For 1963 and earlier years, the difference between the sum of individual and partnership forms of organization and the total for noncorporate is represented by other noncorporate forms including cooperatives, establishments operated by estate administrators, trusteeships, receiverships, public and quasi-public organizations, and, in addition, the misassignment of small establishments that were not corrected since they were not statistically significant. For 1977, 1972, and 1967, this category is shown for each industry and for all manufacturing total.

[5]In 1967, administrative records were not identified by legal form of ownership or as single-unit or multiunit companies. However, the administrative records are all for single-unit establishments.

[6]In the 1967 census, no legal form of ownership information was available for classifying administrative records. In the 1972 and 1977 censuses, legal form of ownership data were supplied by the Internal Revenue Service, and administrative records were tabulated based on this data. For comparison purposes, the following are total 1972 and 1977 census data for administrative records:

Year	Establishments number	All employees		Production workers		Value added (million dollars)	Capital expenditures, new (million dollars)
		Total (1,000)	Payroll (million dollars)	Total (1,000)	Wages (million dollars)		
1977..	144,662	460.7	5,177.7	378.4	3,348.2	11,110.9	713.5
1972..	122,164	382.0	2,626.0	328.0	1,795.0	5,957.0	376.0

– Represents zero. (D) Withheld to avoid disclosing operations of individual companies. ʳ Revised by 3 percent or more from figure published in final industry reports. Data for other items for this industry have also been revised. (Z) Less than 50 thousand dollars or hours; under 50 employees.

[1]All data are based on reports for individual manufacturing establishments and not on a company basis. Each establishment of multiestablishment companies is classified by its primary industrial activity. For this reason the statistics presented in this table cannot be compared directly with tabulations in which the whole corporation is the reporting unit and the entire company is classified in one industry--for example, the "Statistics of Income, Corporation Income Tax Returns," compiled by the Bureau of Internal Revenue, U.S. Treasury Department. Establishments were classified as part of a multiunit company when the company operated two establishments or more, of which at least one was a manufacturing establishment.

[2]Includes expenditures for plants in operation and for plants under construction but not yet in operation.

[3]Establishments in this industry reported value of production rather than value of shipments. Consequently, the formula for computing adjusted value added by manufacture was modified to include only changes in work-in-process inventories between the beginning and end of the year.

[4]Establishments in this industry reported value of work done instead of value of shipments. Consequently, the formula for computing value added by manufacture was not adjusted for any inventory change between the beginning and end of the year. It does not include value added by resales.

Water Use in Manufacturing

EXPLANATORY TEXT

SUMMARY OF FINDINGS

While manufacturing industries are important users of water in the United States, the utilization by such establishments is highly concentrated. According to the 1978 survey, establishments with an annual water intake of 20 million gallons of water or more accounted for about 95 percent of water withdrawn for manufacturing purposes. These plants, however, represent only about 3 percent of the total number of manufacturing establishments and employ approximately 34 percent of the total number of persons engaged in manufacturing within the major groups covered in this survey. (See table A.)

Approximately 84 percent of the 13.0 trillion gallons consumed by manufacturing establishments in 1978 was accounted for by four SIC major industry groups; namely, Major Group 33, Primary Metal Industries; Major Group 28, Chemicals and Allied Products; Major Group 26, Paper and Allied Products; and Major Group 29, Petroleum and Coal Products. Even within these major groups, specific industries accounted for the major share, blast furnaces and steel mills consumed about 21 percent of the total manufacturing consumption of water, and manufacturers of industrial organic chemicals used about 17 percent of the total. About 76 percent of industrial water was consumed by establishments located in six water use regions; namely, the Great Lakes, the Ohio River, the Middle Atlantic, the Texas Gulf, the Lower Mississippi, and the South Atlantic.

While the quantity of water intake by manufacturing establishments is relatively large, the quantities actually consumed in process, by evaporation, etc., is only about 10 percent of the withdrawals. Data on net use, as defined above, may be calculated in the tables shown in this report by subtracting water discharged from water intake. Gross water use, as shown in the tables, reflects recirculation or reuse of the water in the same establishments and partially reflects water management.

GENERAL

This report presents statistics on the use of water by manufacturing establishments for 1978 with selected comparable historical data.

Information on industrial water use by manufacturing establishments was first collected and published by the Bureau of the Census in the 1953 Annual Survey of Manufactures. In the 1954 Census of Manufactures, as in the 1963 census, information on water use was collected from all manufacturing establishments employing six people or more, except for establishments in the printing and publishing and apparel industries. The latter establishments are relatively small water users and/or operate primarily in rented quarters where water is usually furnished by the landlord.

Information was not collected in the 1958 Census of Manufactures. However, a special post-census survey was taken in 1959 which included all establishments reporting water use of 20 million gallons or more in 1954, as well as all companies having at least one establishment with 250 employees or more in the 1958 Census of Manufactures. In industries known to be extensive water users, all establishments with 100 employees or more were included.

Detailed information on water utilization was collected and published in a post-census survey for all manufacturing establishments using 20 million gallons of water or more annually for 1968, 1973, and 1978.

SCOPE AND COVERAGE OF SURVEY

In the 1977 Census of Manufactures, the standard census forms submitted by all establishments employing 10 people or more contained a check-type question on water consumption in terms of broad-size ranges of gallons used. Approximately 16,200 establishments indicated the use of 20 million gallons or more of water in 1977. These "large" water users were included in the mailing of the special water use survey for 1978. Of that number, 9,605 reported detailed information.

Most of the other 6,595 establishments indicated that water use in 1977 was less than 20 million gallons and are, therefore, excluded from this study. All data for water use exclude government-owned establishments operated by private contractors for the account of the Atomic Energy Commission. The 1958 through 1978 figures include data for establishments located in Alaska and Hawaii. The 1954 figures exclude those establishments.

Information from the check-type question on water use on the 1977 Census of Manufactures forms has been used to calculate coverage measures shown in tables A and B. The question requested respondents to identify a water-intake range which consisted of six possible choices:

1. Under 1 million gallons.
2. 1-9 million gallons.
3. 10-19 million gallons.
4. 20-49 million gallons.
5. 50-99 million gallons.
6. 100 million gallons or more.

Value for industry group and State intake levels were derived by combining the reported data from the 1978 Survey of Water Use with estimates of water intake for those establishments not reporting in the 1978 subject survey. Establishments falling in the latter category were assigned the mid-point of the above ranges which they selected on their

1977 census forms. These values were combined with the 1978 reported data and tabulated to the major industry group and State level to form the universe estimates. The measure of water intake coverage shown in tables A and B consist of the comparison of these universe estimates with the data reported in the 1978 Survey of Water Use.

In using this coverage measure, the data user should note the assumption made that water use was consistent between 1977 and 1978.

PRESENTATION OF DATA

The arrangement of the data is by industry, water use region, and State. The boundaries for States are political, while those for water use regions are combinations of counties without regard for State lines. These regions, which center around river basins, were developed in consultations with the Federal agencies having responsibility for water development or use and with representatives of private industry, and they approximate the major drainage systems in the country. Descriptions of the water use regions are included in appendix I. It was not possible to follow the exact definitions because water use regions sometimes split counties. For technical reasons, county lines were followed in this survey for purposes of tabulating water use region data. The areas included are shown in a series of maps appearing in this report. The industry classifications used are based on the 1972 edition of the Standard Industrial Classification (SIC) Manual. (See Introduction.)

Totals for water use have been provided for the SIC industry classifications at the 2-, 3-, and 4-digit levels. Differences in manufacturing processes are not as great at the SIC 4-digit level as at the higher order 2- and 3-digit levels. Accordingly, the water use statistics are most meaningful when examined on a 4-digit SIC basis and related to the processes, products, employment data, etc., at that level. The aggregations at the 3-digit, and especially at the 2-digit levels, represent totals for industries which differ widely in processes used, materials fabricated, or products produced. Thus, for example, the water consumption use for SIC Major Group 26, Paper and Allied Products, will differ in the Columbia-North Pacific water use region from that in California-South Pacific water use region because of industrial composition as well as geography or other factors.

Table A. **Comparison of Statistics for All Manufacturing Establishments With Those Establishments Reporting Water Intake of 20 Million Gallons or More by Major Industry Groups: 1978**

SIC code	Major industry group	Establishments			Water intake			Employment			Value added by manufacture

[1]Source: 1977 Census of Manufactures.

[2]Values for total industry group and State intake levels were derived by combining the 1978 reported data with estimates of water intake for those establishments not reporting in the 1978 subject survey. In the 1977 Census of Manufactures, respondents were requested to identify a range out of six alternatives which included their level of water intake for 1977. All establishments not included in the 1978 survey were assigned the mid-point value of the range which they selected on their 1977 census forms. These estimates were combined with the reported data from the 1978 survey and tabulated to the industry group and State levels. In comparing these total industry group and State level estimates with the data reported in the 1978 Water Use Survey, the data user should be aware of the assumption made that water use was consistent between 1978 and 1977.

[3]Includes data for establishments classified in Major Industry Group 23, Apparel and Other Textile Products; Major Industry Group 27, Printing and Publishing; and administrative and auxiliary establishments for all major groups.

- Represents zero. (D) Withheld to avoid disclosing operations of individual companies. (NA) Not available. (Z) Less than 500 million gallons; less than 500 thousand dollars; less than .05 percent.

[1]Total gross water used is equal to the sum of water intake and water recirculated and reused less evaporation and consumption.

[2]Excludes establishments classified in Major Industry Group 23, Apparel and Other Textile Products, and Major Industry Group 27, Printing and Publishing.

[3]For 1973, data for recirculated and reused water was not collected but were derived from gross water used and water intake. The derived recirculated and reused water data are not directly comparable to 1978 data and therefore, are not presented.

[4]Includes establishments classified in Major Industry Group 23, Apparel and Other Textile Products, and Major Industry Group 27, Printing and Publishing. In 1959, such establishments had total water intake of 23 billion gallons, gross water use of 58 billion gallons, and water discharge of 22 billion gallons.

[5]In 1972, major industry groups 30 and 34 were redefined. Data for previous periods are not comparable with those for 1973 and 1978, and have, therefore, been suppressed.

Table 1b. Summary Water Use Statistics for Industry Groups and Industries: 1978

Note: Figures shown for industry groups (3-digit) and major industry groups (2-digit) include data for all component industries whether or not separate figures are shown for individual industries within the group.

- Represents zero. (D) Withheld to avoid disclosing operations of individual companies. N.E.C. Not elsewhere classified. (S) Data is inconsistent with other reported data and, therefore, is being withheld. Suppressed values for gross water used may be estimated from data shown for water intake and recirculated water. (X) Not applicable. (Z) Less than 50 million gallons or under .5 percent.

[1]All industries, except those in Major Industry Group 23, Apparel and Other Textile Products, and Major Industry Group 27, Printing and Publishing, were candidates for inclusion in this survey. Specific 4-digit industries in other major industry groups not listed in this table had no establishments with use of 20 million gallons of water or more in 1978.

- Represents zero. (D) Withheld to avoid disclosing operations of individual companies. (S) Data is inconsistent with other reported data and therefore, is being withheld. Suppressed values for gross water used may be estimated from data shown for water intake and recirculated water. (Z) Less than 50 million gallons or under .5 percent.

[1]See appendix H for maps and appendix I for definitions.

Table 2a. Water Intake, by Source and by Kind, for Industry Groups and Industries: 1978

Note: Figures shown for industry groups (3-digit) and major industry groups (2-digit) include data for all component industries, whether or not separate figures are shown for individual industries in the group. Industries omitted from table have a water intake level of less than .05, or have data withheld to avoid disclosure.

-Represents zero. (D) Withheld to avoid disclosing operations of individual companies. N.E.C. Not elsewhere classified. (Z) Less than 50 million gallons.

Table 2b. Water Intake, by Source and by Kind, for States: 1978

(All figures in billions of gallons, except where noted. For explanation of terms, see appendix A)

Note: Figures shown for industry groups (3-digit) and major industry groups (2-digit) include data for all component industries whether or not separate figures are shown for individual industries in the group. Industries omitted from the table have a level of gross water use of less than .05 or have data being withheld to avoid disclosure.

- Represents zero. (D) Withheld to avoid disclosing operations of individual companies. N.E.C. Not elsewhere classified. (S) Data is inconsistant with other reported data and, therefore, is being withheld. Suppressed values for gross water used may be estimated from data shown for water intake and recirculated water. (Z) Less than 50 million gallons.

Table 5b. Water Recirculated and Reused, by Purpose, for States: 1978

34	FABRICATED METAL PRODUCTS	1	(D)	(D)	(D)	(D)	(D)	(D)	(D)	(D)

Note: Water use regions or major industry groups which have been omitted from table have water intake of less than .05 or have data withheld to avoid disclosure.

- Represents zero. (D) Withheld to avoid disclosing operations of individual companies. (S) Data is inconsistent with other reported data and, therefore, is being withheld. Suppressed values for gross water used may be estimated from data shown for water intake and recirculated water. (Z) Less than 50 million gallons.

[1] See appendix H for maps and appendix I for definitions.

Note: Figures shown for industry groups (3-digit) and major industry groups (2-digit) include data for all component industries, whether or not separate figures are shown for individual industries in the group.

Industries which have been omitted from the table have total water discharge of less than .05 or have data being withheld to avoid disclosure.

- Represents zero. (D) Withheld to avoid disclosing operations of individual companies. N.E.C. Not elsewhere classified.

(Z) Less than 50 million gallons.

Note: Figures shown for industry groups (3-digit) and major industry groups (2-digit) include data for all component industries, whether or not separate figures are shown for individual industries in the group.

Industries which have been omitted from the table have total water discharge of less than .05 or have data withheld to avoid disclosure.

- Represent zero. (D) Withheld to avoid disclosing operations of individual companies. N.E.C. Not elsewhere classified. (Z) Less than 50 million gallons.

Note: Figures shown for water use regions include data for all major industry groups whether or not separate figures are shown for individual major industry groups in the region. Water use regions or major industry groups omitted from the table discharge no treated water or have data being withheld to avoid disclosure.

- Represents zero. (D) Withheld to avoid disclosing operations of individual companies. (Z) Less than 50 million gallons.

[1]See appendix H for maps and appendix I for definitions.

TABLES

COMPANY STATISTICS

1. Share of Total Value Added by Manufacture Accounted for by the 50, 100, 150, and 200 Largest Manufacturing Companies: 1977 and Earlier Years 7
2. Share of Total Value Added by Manufacture Accounted for by the 50 and 100 Largest Identical Manufacturing Companies as Ranked in Each Year: 1977 and Earlier Years 7
3. Changes in Rank Group of the 50 Largest Identical Companies: 1977 and Earlier Years 8
4. Share of Value Added, Employment, Payroll, Value of Shipments, and Capital Expenditures Accounted for by the 200 Largest Companies: 1977, 1972, 1967, and 1963 9

INDUSTRY STATISTICS

5. Distribution of 4 Largest Company Concentration Ratios by Industry Group: 1977. 10
6. Changes in 4 Largest Company Concentration Ratios by Industry Group Between 1972 and 1977. 11
7. Share of Value of Shipments Accounted for by the 4, 8, 20, and 50 Largest Companies in Each Manufacturing Industry: 1977 and Earlier Years. 12
8. Share of Selected Items Accounted for by the 4 Largest Companies and Complementary Groupings Ranked on Value of Shipments for Each Industry: 1977 66

PRODUCT CLASS STATISTICS

9. Share of Value of Shipments of Each Class of Product Accounted for by the 4, 8, 20 and 50 Largest Companies: 1977 and Earlier Years. 123
10. Share of Value of Shipments of Selected Product Classes Primary to More Than One Industry Accounted for by the 4 and 8 Largest Companies: 1977 and Earlier Years. 268

EXPLANATORY TEXT

GENERAL

This report provides ratios on the share of industrial activity accounted for by the largest companies, both for the United States as a whole and for each of approximately 450 manufacturing industries. It brings forward the information published in the 1972 Census of Manufactures report, Concentration Ratios in Manufacturing.

The first presentation of concentration ratios in manufacturing by the Bureau of the Census was made in 1939 and was based on the 1935 Census of Manufactures. Ratios for all manufacturing industries were presented in the National Resources Committee publication, The Structure of the American Economy. From the 1937 Census, concentration ratios were presented for a large sample of individual products. Beginning in 1947, with the first full census following World War II, concentration ratios have been presented as a part of every census of manufactures. In 1954, 1958, and 1963, the Bureau conducted the project in cooperation with the Senate Subcommittee on Antitrust and Monopoly. The Census Bureau has continued to present this widely-used report in the censuses of 1967, 1972, and, now, 1977 for the benefit of data users in the industrial, educational, and governmental communities.

As in previous reports, no attempt is made to interpret the significance of the concentration ratios. The ratios are not used as the basis for an analysis of either the causes or effects of concentration. The report consists merely of a presentation of the ratios themselves.

Through years of usage, the term "concentration ratio" has come to mean the share of the total activity or resources of a given segment of the economy accounted for by its largest companies. In order to avoid disclosure of the operations of any individual firms, concentration ratios based on census data are presented in groups of four or more companies, that is, the four largest, the eight largest, and so forth.

CONCENTRATION RATIOS AND THE ESTABLISHMENT BASIS OF REPORTING

The concentration ratios based on census of manufactures data have consistently been prepared from establishment reports. Under the establishment system, the shipments of a given company are distributed among all of the industries in which it has establishments. In tables 1 through 4 in this report, which reflect the activity of the largest companies in the industrial sector as a whole, the establishment approach means that only the manufacturing establishments of these companies are taken into account in determining their size. In table 7, a "company" is defined as the total of the individual establishments under one ownership within an industry. Consequently, the same company may appear in several industries, if it has diversified activities.

CONCENTRATION RATIOS AND THE SIC SYSTEM

In essence, the SIC system seeks to establish spheres of economic activity which are unique and distinguishable because of a composite of similar characteristics which they have in common. These characteristics include similarity of products in terms of their uses and the bringing together of plants which specialize in making these products and account for a significant proportion of their total shipments. They also include similarity of processes, similarity of materials used, and the bringing together of a group of plants which are economically significant in terms of their number, value added by manufacture, value of shipments, and number of employees. These standards flow very largely from the actual structure into which American businesses have grouped themselves, and it is these characteristics that make it the best single system for the largest number of uses. In the great majority of instances, an industry is comprised of producers of similar goods or services. Usually, but not always, the products are made of similar materials and by similar processes and the producers usually compete with one another.

For the purpose of measuring concentration, the fact that the classification system is not based exclusively on the usage of the product is somewhat of a limitation, since in the economic concept of the market, it is immaterial whether products which are substitutable for each other are produced by the same processes or made from the same materials. In some cases, the industry and product definitions are too broad; that is, there are included in the same category products which do not serve the same function and are, thus, not substitutable for each other; in other cases they are too narrow; that is, a single category fails to include products which are substitutable—for example, metal and glass containers. Another limitation is the fact that the classification's industries and products are regularly being redefined. The need for redefinition arises particularly from the introduction of new products, the declining importance of older products, the introduction of new technologies, the growth of small fields into important industries, and similar dynamic developments. While necessary to keep the classification abreast of the changing nature of the economy, an inevitable cost of redefinition is the loss of comparability for many categories over time.

LIMITATIONS IN USE OF CONCENTRATION RATIOS

Like all bodies of statistical data, the concentration ratios must be used with an awareness of both their attributes and limitations. The preceding discussion has described, in some detail, the nature of the data and the classification system used to aggregate the data. There are also other considerations which must be kept in mind as the late Senator Estes Kefauver discussed in his letter

to the Honorable James O. Eastland, Chairman of the Senate Committee on Judiciary, transmitting the 1958 report. The following is a quotation from that letter:[1]

"At this point, it may be useful to discuss the principal sources of understatement and overstatement of the concentration ratios.

"From the point of view of the economic concept of the market, there are several sources of possible understatement of the concentration ratios. The identification of which plants are controlled by which companies is based on census reports and available public records. As part of each census, the known large companies are sent a questionnaire requiring them to list the plants which they operate directly or through their subsidiaries and affiliates. For census purposes the company consists of those establishments which it owns or admits control over and which have been classified as chiefly manufacturing. Obviously, any instances in which there exists control not reported to the Census Bureau results in an understatement of the concentration ratios.

"A second source of understatement stems from the fact that the concentration ratios presented herein relate to the Nation as a whole. Where the market area is limited by the perishability of the product, by relatively high transportation costs or other factors, concentration in the individual geographic markets may be considerably higher than is shown by national concentration ratios. Thus, for the Nation as a whole the share of the value of shipments of the bread and related products industry accounted for in 1954 by the four largest companies was 20 percent. Yet, a special tabulation based on the same data showed that in only three individual States was the share of the value of shipments of the 4 largest companies in that State less than 30 percent, while in 23 States the figure was over 50 percent, and in the actual individual market areas represented by cities, the level of concentration tended to be even higher.[2]

"A third source of understatement arises from the defining of many of the industries and some of the product classes in terms so broad as to include non-substitutable products. The extent to which the industry and product definitions conform to the actual character of the market differs considerably from industry to industry and product to product. On the one hand is a four-digit industry, cigarettes, which would appear to be an adequate representation of the market. At the other extreme is steel works and rolling mills, also a four-digit industry, which produces many individual products. With few exceptions, these products are generally not substitutable for each other. There is no market for steel, as such; there are individual product markets for structural shapes, tinplate, rails, etc. Although in some cases the more expensive forms of cold-rolled sheet and strip can be substituted for cheaper hot-rolled products, this occurs only when the buyer is forced to do so during periods of tight supply. Since the level of concentration usually tends to rise as the definition is narrowed, it follows that in such cases the concentration ratio for the industry may significantly understate the concentration in the individual product markets. In 1954 the concentration ratio for steelworks and rolling mills was 54 percent. Yet, according to a separate study, for all but 6 of the industry's 39 individual products, the 4 largest companies in 1957 accounted for over 60 percent of the production, while the average concentration ratio of the 39 products was 69 percent.[3] There is, however, a limit on the extent to which concentration in the market can be approached by progressively narrowing the definitions of industries and products. This is the limit imposed by product substitutability.

"Where the definition of the industry or the product is so narrow as to exclude substitutable products, the concentration ratio will overstate the concentration in the market. Thus, because metal cans are classified in one industry and glass containers in another, the concentration ratios for each will overstate the concentration in those markets for which metal cans and glass containers are in fact substitutable.

"What makes one product substitutable for another depends not only on physical characteristics but also on the critical matter of price. Thus, it could be said that for some uses, platinum is substitutable for steel, but the difference in price is so vast that they are not in fact economically substitutable. Because the question of what makes one product substitutable for another depends on price, changes in buyers' tastes, and other highly variable factors, substitutability varies over time and it is impossible to set forth any mechanical means of arbitrarily determining degrees of substitutability.

"A second source of overstatement in the domestic market is the exclusion of imports. While imports into the United States of manufactured goods taken as a whole are relatively small, amounting in 1958 to only $8 billion, or less than 5 percent of the $141 billion of value added by manufacture of all domestic American establishments, they are important for a

[1] 87th Congress, 2nd Session. Report of Subcommittee on Antitrust and Monopoly of the Committee on the Judiciary, "Concentration Ratios in Manufacturing Industry, 1958,". Part I, page IV.

[2] S. Rept. 1923, 86th Cong., 2d sess. (1960), "Administered Prices: Bread"; report of the Senate Subcommittee on Antitrust and Monopoly, pp. 120-125.

[3] S. Rept. 1387 85th Cong., 2d sess. (1958), "Administered Prices: Steel"; report of the Senate Subcommittee on Antitrust and Monopoly, pp. 69.

number of individual industries. Thus, considerable proportions of the total sales in the United States of such products as sewing machines and typewriters consist of imports. In such cases, the concentration ratios applicable to domestic manufacturing will tend to overstate the concentration in the market. The overstatement would be reduced, however, to the extent that the imports were produced in overseas factories of the largest domestic companies.

"While these limitations must be borne in mind in any use of the concentration ratios, their importance should not be overstressed. For one thing, the limitations will generally tend to have less effect on the use of the ratios to show changes in concentration over time than in depicting the level of concentration in the market at a given point of time. This is because the factors making for under- or over-statement are usually present both at the beginning and the end of the time span for which the change is measured. The use of the ratios to show change in concentration is, thus, affected only where the factors making for under- or over-statement are relatively more important in one year than in another. Moreover, many of the product classes and a not inconsiderable number of the industries do represent reasonably adequate representations of concentration in that market. And, where this is not so, they provide, at the very least, a starting point to which appropriate adjustments to allow for the various sources of under- and over-statement can be made."

EXPLANATION FOR TABLES 1 TO 4

These four tables reflect the activity of the largest companies in the industrial sector as a whole. A "company" is defined, for this purpose, as the total of its industrial establishments, including not only its manufacturing plants but also auxiliary establishments such as warehouses and central administrative offices.

Concentration at this level is measured in terms of value added by manufacture. In these census tabulations, value added is preferable to sales or shipments in measuring total company size, since an aggregation of shipments from the census establishment records would contain duplication owing to intracompany transfers of products. Value added for all manufacturing establishments of a given company was aggregated irrespective of the industry classification of the individual establishments. The companies were then arrayed by magnitude of value added in each specified year and totals computed for the 50, 100, 150, and 200 largest companies.

The standard formula for calculating value added by manufacture since 1958 differs from the one used for the 1954 census and earlier years. During the earlier period, the value added of an establishment was calculated by subtracting the cost of materials, supplies, containers, fuels, purchased electric energy, and contract work from the value of shipments for products manufactured plus miscellaneous receipts for services rendered. This is known as unadjusted value added in census publications. Beginning with 1958, the measure of value added has been adjusted for each establishment in two respects. Value added now includes: (1) Value added by merchandising (that is, the difference between the sales value and cost of merchandise sold without further manufacture, processing, or assembly); and (2) an adjustment for the net change in finished goods and work-in-process inventories between the beginning and the end of the year. The resulting figure is the adjusted value added.

Thus, the rankings of the 200 largest companies in 1947 and 1954 were based on unadjusted value added; those for later years were based on adjusted value added. The use of these different measures for determining size should have little effect on the ranking and relative shares of individual companies or on the aggregate shares of the 50, 100, 150, or 200 largest companies in each year.

Except for tables 2 and 3, companies were classified in size groups in each particular year based on their size in that year. Thus, a size group (such as the top four) does not necessarily include the same companies from year to year. The extent to which large companies have grown or declined over the years is reflected in tables 2 and 3. Table 3 shows, for example, that, of the companies which constituted the 50 largest in 1972, only 33 were among the 50 largest in the 1954 census.

EXPLANATION FOR TABLES 5 AND 6

Tables 5 and 6 are frequency distributions of the 4-company concentration ratio data in table 7. In table 5, the 4-digit industries and their associated value of shipments (value added for selected industries) are distributed by 2-digit major industry group and, within each group, by concentration ratio size class. In table 6, the 4-digit industries are distributed by 2-digit major industry group and within each group by size of change in 4 largest company ratios: 1972 to 1977.

In using the distribution in table 5 by the major 2-digit industry groups, it should be recognized that the latter are broader than the concept of the market. Food and kindred products, for example, encompass a wide range of discrete industries, the products of which are often not substitutable for each other. The value of the table lies in showing the distribution of differing concentration ratios of the individual industries and the amount of the value of shipments of a major group accounted for by industries with high, medium, and low concentration ratios.

EXPLANATION FOR TABLE 7

This table is based on the establishment approach described in the Introduction. A "company" is defined as the total of the individual establishments under one ownership within an

industry. Consequently, the same company may appear in several industries if it has diversified activities. In addition, the following points should be kept in mind:

(1) The top 4, 8, 20, and 50 companies are the largest for any particular year based on their value of shipments in that year and are, therefore, not necessarily the same companies from year to year.

(2) For a few industries, as indicated by footnotes, value added by manufacture rather than value of shipments has been used to determine the size of companies. This is considered necessary for industries in which the aggregate value of shipments contains a large amount of duplication because of shipments of semifinished products between establishments. An example is SIC 3585, Air-Conditioning and Warm Air Heating Equipment and Commercial and Industrial Refrigeration Equipment, in which there are extensive intraindustry sales and transfers of components and subassemblies to producers of complete refrigerators and air conditioners. (The historical changes in the method for calculating value added by manufacture are described in the discussion of tables 1 through 4.)

(3) Ratios are shown for years prior to 1972 only if the SIC industry definitions were considered comparable. As noted in the Introduction, there were extensive revisions in the SIC in 1972 which, in table 7, result in suppression of data for earlier years for a substantial number of industries. In general, the criteria used for judging the comparability of definitions was the effect of the change on number of employees in the industry under the old and new definitions. If the new definition caused more than a 2-percent change, the historical data were suppressed.

(4) The 1966, 1970, and 1976 concentration ratios are based on data developed in the Annual Survey of Manufactures. Since the industry aggregates which provide the denominators in the concentration ratios are based on a sample, they are subject to sampling errors. Sampling errors for each industry, as well as a more complete description of the Annual Survey of Manufactures sample, are shown in appendix B.

EXPLANATION FOR TABLE 8

In this table, a "company" is defined as the total of the individual establishments under one ownership within an industry. Consequently, the same enterprise may appear in several industries if it has diversified activities. It may be large in some industries and small in others.

Company size within an industry is determined by the total value of shipments and other receipts of its establishments. In addition to sales to customers, this total includes the value of products transferred between establishments of the same company (intracompany transfers). For a few industries, as indicated by footnotes, value added by manufacture rather than value of shipments has been used to determine company size. This was considered necessary for industires in which the aggregate value of shipments contains a large amount of duplication because of shipments of products between establishments.

Within an industry, each line of the table was based on the same companies throughout the line. The ranking of the four largest companies, for example, was determined by their value of shipments (or value added) and the other percentages represent the proportions of employment, payrolls, etc., accounted for by the same four companies.

EXPLANATION FOR TABLES 9 AND 10.

The product classes (5-digit) and product groups (4-digit) shown in these tables are those developed by the Census Bureau within the framework of the Standard Industrial Classification. In general, the first four digits of the product code numbers refer to the SIC industry in which the product is primarily made. For example, in the product class number 20232, Canned Milk products, the first four digits (2023) identify the Condensed and Evaporated Milk industry. The four-digit code numbers shown in these tables (followed by a hypen) identify product groups rather than industries. The number 2023 identifies the total shipments of condensed and evaporated milk products, whether made in industry 2023 or in other industries. Complications occur in the few SIC industries defined in terms of processes or equipment used, as well as products made. As an example, processed pork as a product of slaughtering plants is coded 20126, but if made in meat processing plants, is coded 20136. Since these products are similar despite the SIC distinction, data for them have been brought together in this publication in table 10.

Within each product class or group shown in tables 9 and 10, a "company" is represented by the sum of the shipments of that product by all of its manufacturing plants. Consequently, the same company often appears in several different product classes or groups.

As discussed in the section on Census Report Forms, establishments with fewer than 10 employees were excused from filing census reports. Limited data on payrolls, sales, and industry classification were made available to the Census Bureau from administrative records of the Social Security Administration and the Internal Revenue Service. For total manufacturing, these establishments account for less than 3 percent of the payrolls and value added, but this proportion is somewhat larger for industries characterized by small establishments such as lumber, printing, and apparel. The effect of using administrative records for these establishments generally increases the proportional size of the "not specified by kind" (n.s.k.) product classes, because their shipments could not be assigned to specific 5-digit product classes. Also included in this n.s.k. category are those establishments with 10 employees or more which, for various reasons, did not report the product class detail.

Concentration ratios are not shown for the n.s.k. product classes since they would be of little or no significance. However, if there is a significant increase in the value of shipments of an n.s.k. product class, the establishments comprising the n.s.k. are analyzed and some or all of their value of shipments prorated to the specific 5-digit classes affected. Their concentration ratios are then recalculated.

Table 1. **Share of Total Value Added by Manufacture Accounted for by the 50, 100, 150, and 200 Largest Manufacturing Companies: 1977 and Earlier Years**

Company rank group	Percent of value added by manufacture										
	1977	1976	1972	1970	1967	1966	1963	1962	1958	1954	1947
Largest 50 companies	[1]24	[1]24	25	24	25	25	25	24	23	23	17
Largest 100 companies	33	33	33	33	33	33	33	32	30	30	23
Largest 150 companies	39	39	39	38	38	38	37	36	35	34	27
Largest 200 companies	44	44	43	43	42	42	41	40	38	37	30

Note: 1962, 1966, 1970, and 1976 data are based on the annual survey of manufactures. "Largest companies" are those which were the largest in each of the specified years.

[1]As a result of rounding these percentages to whole numbers, the 1977 and 1976 largest 50 companies ratios show a significant decrease from 1972 levels. The decrease is actually much smaller; see table 4 for unrounded percentages for 1972. The 1976 unrounded figures are available in the 1976 Annual Survey of Manufactures publication, "Concentration Ratios in Manufacturing: 200 Largest Companies."

Table 2. **Share of Total Value Added by Manufacture Accounted for by the 50 and 100 Largest Identical Manufacturing Companies as Ranked in Each Year: 1977 and Earlier Years**

Year of company ranking and company rank group	Percent of value added by manufacture									
	1977	1972	1970	1967	1966	1963	1962	1958	1954	1947
1977										
Largest 50 companies	24	24	23	23	24	23	22	21	20	14
Largest 100 companies	33	32	31	30	30	29	28	26	25	18
1972										
Largest 50 companies	24	25	23	23	23	22	22	20	19	12
Largest 100 companies	33	33	31	30	30	29	28	26	25	17
1970										
Largest 50 companies	23	23	24	23	24	23	22	20	19	12
Largest 100 companies	33	32	33	31	31	29	29	26	25	18
1967										
Largest 50 companies	23	22	24	25	25	24	24	22	21	15
Largest 100 companies	31	30	32	33	33	32	31	29	28	20
1966										
Largest 50 companies	23	22	23	24	25	24	24	22	21	14
Largest 100 companies	31	30	31	32	33	32	31	29	28	21
1963										
Largest 50 companies	22	21	23	24	24	25	24	23	22	15
Largest 100 companies	30	29	31	32	33	33	32	30	29	21
1962										
Largest 50 companies	23	22	23	24	25	25	24	23	22	15
Largest 100 companies	30	29	31	33	33	32	32	30	29	21
1958										
Largest 50 companies	22	20	22	23	24	24	24	23	23	16
Largest 100 companies	29	27	29	31	31	32	31	30	29	22
1954										
Largest 50 companies	21	20	21	23	23	24	23	23	23	16
Largest 100 companies	28	27	28	31	31	31	30	30	30	21
1947										
Largest 50 companies	19	17	19	20	21	21	21	20	21	17
Largest 100 companies	25	24	26	27	27	28	27	27	27	23

Note: The 100 largest companies in each specified year were selected and their proportion of total value added by manufacture in each of the other years was computed. Thus, this table measures the changes in concentration ratios for a fixed group of companies from one year to another. In case of mergers, the larger of the two at the time of merger was considered to be the predecessor company.

Table 3. **Changes in Rank Group of the 50 Largest Identical Companies: 1977 and Earlier Years**

Year of company ranking and company rank group	Number of companies									
	1977	1972	1970	1967	1966	1963	1962	1958	1954	1947
1977										
Among 50 largest	50	43	41	39	38	34	36	32	30	23
Among 51st to 100th largest	-	7	9	9	8	9	7	8	12	10
Among 101st to 200th largest	-	-	-	1	2	4	4	6	1	10
Not among 200 largest	-	-	-	1	2	3	3	4	7	7
1972

Among 51st to 100th largest	7	4	-	5	5	6	6	5	10	10
Among 101st to 200th largest	1	1	-	-	1	3	3	7	3	9
Not among 200 largest	1	-	-	-	-	-	-	2	4	6
1967										
Among 50 largest	38	42	45	50	46	43	41	35	32	24
Among 51st to 100th largest	9	7	5	-	3	6	8	8	12	10
Among 101st to 200th largest	2	1	-	-	1	1	1	6	4	12
Not among 200 largest	1	-	-	-	-	-	-	1	2	4
1966										
Among 50 largest	39	43	45	46	50	42	43	36	33	25
Among 51st to 100th largest	8	4	4	3	-	8	6	9	12	10
Among 101st to 200th largest	1	1	-	-	-	-	1	4	3	12
Not among 200 largest	2	2	1	1	-	-	-	1	2	3
1963										
Among 50 largest	35	40	41	43	42	50	46	42	38	30
Among 51st to 100th largest	12	9	8	7	8	-	4	6	10	10
Among 101st to 200th largest	2	-	-	-	-	-	-	2	2	10
Not among 200 largest	1	1	1	-	-	-	-	-	-	-
1962										
Among 50 largest	37	40	41	41	43	46	50	42	38	29
Among 51st to 100th largest	9	9	8	9	7	4	-	7	11	10
Among 101st to 200th largest	3	-	-	-	-	-	-	1	1	10
Not among 200 largest	1	1	1	-	-	-	-	-	-	1
1958										
Among 50 largest	33	36	36	35	36	42	42	50	45	34
Among 51st to 100th largest	11	10	10	14	14	8	8	-	5	10
Among 101st to 200th largest	4	2	3	1	-	-	-	-	-	6
Not among 200 largest	2	2	1	-	-	-	-	-	-	-
1954										
Among 50 largest	31	33	33	32	33	38	38	45	50	35
Among 51st to 100th largest	11	9	11	16	16	11	11	4	-	11
Among 101st to 200th largest	5	5	4	1	-	1	1	1	-	3
Not among 200 largest	3	3	2	1	1	-	-	-	-	1
1947										
Among 50 largest	24	25	24	24	25	30	29	34	35	50
Among 51st to 100th largest	13	13	13	17	18	16	16	12	12	-
Among 101st to 200th largest	5	6	8	5	4	3	5	4	3	-
Not among 200 largest	8	6	5	4	3	1	-	-	-	-

Note: 1962, 1966, and 1970 data are based on the annual survey of manufactures--other years on the census of manufactures. The 50 largest companies in each specified year were selected and the rank group of the same companies determined in other years. Thus, this table measures the shifting of position of a fixed group of companies from one year to another. In case of mergers, the larger of the two at the time of the merger was considered to be the predecessor company.

- Represents zero.

Table 4. **Share of Value Added, Employment, Payroll, Value of Shipments, and Capital Expenditures Accounted for by the 200 Largest Companies: 1977, 1972, 1967, and 1963**

(Percent)

Company rank group based on value added by manufacture		Value added by manufacture	All employees		Total payroll		Production workers			Value of shipments[3]	New capital expenditures
			With CAO's[1]	Without CAO's[2]	With CAO's[1]	Without CAO's[2]	Number	Hours	Wages		
50 largest	1977	24.4	17.9	17.1	24.8	23.7	16.2	16.8	23.6	25.3	28.0
	1972	24.5	19.4	18.3	25.1	24.0	17.5	17.9	23.6	24.3	25.8
	1967	24.6	20.2	(NA)	25.2	(NA)	17.8	17.9	22.5	24.7	27.4
	1963	25.0	18.8	(NA)	24.0	(NA)	16.7	17.2	21.9	24.6	28.1

Note: All percentages are independently rounded and do not necessarily add to totals.

(NA) Not available.

[1]Includes employees in central administrative offices and auxiliaries serving manufacturing establishments.

[2]Excludes employees in central administrative offices and auxiliaries serving manufacturing establishments, and, thus, represents operating manufacturing establishments.

[3]Includes a substantial but unmeasurable amount of duplication because of shipments of materials and products among manufacturing establishments for further processing.

Table 5. **Distribution of 4 Largest Company Concentration Ratios by Industry Group: 1977**

(Value figures in millions of dollars)

	1970	(NA)	1,148.0	9	15	(NA)	(NA)	(NA)	(NA)	4
	1967	2,165	943.3	10	17	28	42	94	90	(X)

Note: The figures shown in parentheses either have associated standard errors exceeding 15 percent or are not consistent with other Census series and related data. Thus, these estimates may be of limited reliability.

(D) Withheld to avoid disclosing operations of individual companies. (NA) Not available. (S) Data suppressed because some of the largest companies were approximately the same size as others not included in the sample, and, therefore, a reliable numerator could not be computed. (X) Not applicable.

[1]Industry codes and descriptions are based on the 1972 Standard Industrial Classification Manual (SIC). This classification system represents a substantial revision from the previous 1957 edition as modified through 1967 and was put into effect with the final reports in the 1972 census. The concentration ratios in 1958 were tabulated on the 1945 edition to preserve comparability to prior years. Also, in 1958, establishments in Alaska and Hawaii were not included as part of U.S. industry totals since these States did not attain Statehood until 1959. Data and ratios for 1958 and prior years are shown in this report only if the industry definitions are so closely comparable that the concentration ratios could not be affected by the shifting of plants due to industry classification changes or by the change in treatment of Alaska and Hawaii. (See "Concentration Ratios in Manufacturing Industry: 1958," Part I, table 7, for comparability of old/new industry definitions.)

[2]The determination of company affiliation of establishments is based on census reports and publicly available records. Value of shipment totals or establishments have been summarized into company totals in each manufacturing industry. "Largest" companies are determined by each company's value of shipments in the specified industry.

[3]Value of shipments figures are not completely comparable between the years 1963-72 and prior years. They include for all establishments classified in the industry (a) value of products primary to the industry, (b) value of all secondary products which are primary to other industries, (c) value of miscellaneous receipts such as receipts for contract and commission work on materials owned by others, scrap, salable refuse, repairs, etc., and (d) value of resales--i.e., products resold in same condition as bought. In 1958 and prior years value of resales was excluded from value of shipments.

[4]The percentages consist of the sum of the value of shipments of the largest 4 companies (or 8, 20, or 50 companies), divided by the total value of shipments of the industry.

[5]The "primary product specialization ratio" measures the extent to which plants classified in the industry specialize in making products regarded as primary to the industry; that is, value of shipments of primary products of plants in the industry is expressed as a ratio of the total shipments of all products made by these establishments (excluding miscellaneous receipts, such as receipts for contract and commission work on materials owned by others, scrap and salable refuse, repair, etc.).

[6]The "coverage ratio" measures the extent to which all shipments of primary products of an industry are made by plants classified in the industry, as distinguished from secondary producers elsewhere; that is, value of shipments of the primary products made by plants classified in the industry is expressed as a ratio of the total shipments of primary products made by all producers, both in and out of the specified industry.

[7]A description of the standard error of estimate is given in Appendix B under "Qualifications of the Data". The percentage standard errors shown are approximate relative standard errors of level for the 1970 and 1966 Annual Survey of Manufactures data.

[8]Although the 1972 definition of this industry is the same as that used in the 1967 SIC system, the content of the industry has changed slightly. The net result of these changes accounts for less than 3 percent of the industry aggregate and the 1972 data are considered to be directly comparable to prior years data.

[9]Value added by manufacture is shown for this industry rather than value of shipments because the latter contains a substantial and unmeasurable amount of duplication. The calculations for the 4, 8, 20, and 50 largest companies also are based on value added. The value added figure for 1963 and later years is adjusted value added; for 1958 and prior years, it is unadjusted value added. Adjusted value added is calculated by subtracting the cost of materials including cost of resales from the value of shipments including resales and adjusting for the change in finished products and work-in-process inventories during the year. Unadjusted value added excludes value added by resales and any inventory change. The standard error shown for this industry is for value added by manufacturing.

[10]For 1977, a small number of establishments conducting slaughtering activities were reclassified to industry 2016 from industry 2017 in accordance with industry definitions. As a result, the calculation of specialization and coverage ratios is not comparable with that for 1972. For 1972, industry 2015 was split to form industries 2016 and 2017.

[11]Not completely comparable to 1954 and later years because of a change in industry classification. For discussion of 1947 to 1954 comparability, see 1954 Census of Manufactures, Volume II, Industry Statistics, Dairy Products.

[12]In 1954, Industry 2027, Fluid Milk, was composed of two industries, 2026, Fluid Milk (only), and 2027, Fluid Milk and Other Products. In 1954, figures on value of shipments and share of value of shipments accounted for by the 4 and 8 largest companies have been recalculated on a basis comparable to 1958. In 1947 and earlier years, establishments primarily distributing fluid milk were classified as nonmanufacturing.

[13]Value of production shown for this industry rather than value of shipments. For 1963 and subsequent years, the figure includes value of primary and secondary products made, miscellaneous receipts such as receipts for contract and commission work on materials owned by others, scrap and other salable refuse, and the value of products bought and resold in the same condition; for 1958 and prior years, resales are excluded.

[14]For 1977, the industry classification of several establishments changed to industry 2035 because of a change in the products they produced. As a result, 1977 data are not completely comparable with data for prior years.

Footnotes are continued on next page.

Table 7. **Share of Value of Shipments Accounted for by the 4, 8, 20, and 50 Largest Companies in Each Manufacturing Industry: 1977 and Earlier Years**—Con.

[15]For 1972, this industry was split to form a new industry 2038; in 1970 and prior years, the statistics for industry 2038 were included in Industry 2037, Frozen Fruits and Vegetables.

[16]For 1972, old industry 2042 was split to form new industries 2047 and 2048.

[17]Establishments in Alaska and Hawaii are important producers in this industry. Recomputed figures cannot be shown for the 4, 8, 20, and 50 largest companies prior to 1963 without disclosing the operation of individual companies in Alaska and Hawaii.

[18]The discrepancy between these figures and those appearing in table 1 of the 1958 Census of Manufactures, Volume II, Chapter 20H, Fats and Oils (82 companies and $994,865,000 value of shipments) is due to a misclassification of 16 small companies into industry 2075. These companies should have been classified into Industry 2079, Shortening and Cooking Oils.

[19]The 1957 SIC combined two industries which were separate in the 1945 SIC: Industry 2882, Linseed Oil Mills, and Industry 2884, Vegetable Oil Mills, N.E.C. The 1958 value of shipments figures for these two industries have been combined and the ratios for the 4 and 8 largest companies have been recomputed on a basis comparable to 1963 and later years.

[20]The 1963 SIC combined two industries which were separate in the 1945 SIC: Industry 2886, Grease and Tallow, and Industry 2889, Animal Oils, N.E.C. The 1958 value of shipments figures for these two industries have been combined and the ratios for the 4 and 8 largest companies have been recomputed on a basis comparable to 1963 and later years.

[21]The 1957 SIC combined two industries which were separate in the 1945 SIC: Industry 2092, Shortening and Cooking Oils, and Industry 2093, Margarine. The 1958 value of shipments figures for these two industries have been combined and the ratios for the 4 and 8 largest companies have been recomputed on a basis comparable to 1963 and later years.

[22]Includes data for 21 wholesale distributors of malt liquors. Each had less than 10 employees and had no significant effect on any of the statistics for the industry except the establishment and company counts.

[23]Bonded store rooms which were engaged in blending wines were excluded in 1947.

[24]The 1977 data are not directly comparable to prior years data. A total of 388 establishments were added to this industry accounting for $505 million in value of production. In prior years, the additional establishments were erroneously listed in the administrative record file as non-manufacturing locations.

[25]The 1954 data for industry 2036 are not completely comparable to 1958 and subsequent years; 1947 data are not available. In 1947, Industry 2036, Packaged Seafood, was, in part (frozen packaged seafood), included in Industry 2037, Frozen Fruits, Vegetables, and Fish, and, in part (fresh packaged seafood), included in nonmanufacturing industries (principally Industry 5046, Fish and Seafoods). A significant but undetermined number of establishments classified in industry 2036 in 1958 and 1963 were probably classified in industry 5046 in 1954.

[26]Comparable data are not available because of significant changes in the 1947 classification of plants or products in this industry.

[27]Jobbers were included in 1947 but excluded in 1954 and later years.

[28]Value of production shown for this industry in 1958 and prior years; whereas, value of shipments is shown for 1963 and later years. This change does not affect the comparability significantly. For industries 2253, 2254, 2256 and 2259, the method of computing coverage and specialization ratios was changed in 1967, causing a significant decrease in some ratios.

[29]For 1972, industry 2256 was split to form new industries 2257 and 2258.

[30]The SIC codes combined in this industry are the two industries which were separate in the 1957 SIC: Industry 2255, Knit Glove Mills, and Industry 2259, Knitting Mills, N.E.C. The 1958 value of production figures for these two industries have been combined and the ratios for the 4 and 8 largest companies have been recomputed on a basis comparable to 1963 and later years.

[31]For 1977, industry 2282 was redefined to exclude those establishments which produce filament yarn and texture it in the same plant. These establishments are now included in industries 2823 and 2824. New industry 2282 includes only those plants which purchase filament yarn for texturing.

[32]This industry included a large number of very small establishments in 1958, and there is a possibility that some were misclassified as to industry. Industry misclassification of these small establishments does not affect significantly any statistics other than the number of establishments and companies.

[33]This industry included a large number of very small establishments in 1963 and some of these small establishments may have been misclassified as to industry. Industry misclassification of these small establishments does not affect significantly any statistics other than the number of establishments and companies.

[34]The 1972 definition of this industry has been revised from that used in the 1967 SIC manual. In 1967, industry 2297 was titled Scouring and Combing Mill Products. This is now product class 22993 in Industry 2299, Textile Goods, N.E.C. In 1967, Nonwoven Textiles was product class 22991 in industry 2299.

[35]The 1977 data are not comparable to 1972 data. The 1977 figure covers only products made in cut-and-sew shops; 1972 and prior years figures also include products made in knitting mills.

[36]Includes the shipments of women's and children's knit underwear and nightwear made in knitting mills (primary products of industry 2254) as well as the shipments of these products cut and sewed from purchased knit cloth.

[37]The 1957 SIC combined into this industry four industries which were separate in the 1945 SIC: Industry 2281, Fur-Felt Hats and Hat Bodies; Industry 2282, Wool-Felt Hats and Hat Bodies; Industry 2283, Straw Hats; and Industry 2325, Men's and Boys' Cloth Hats. The 1958 value of production figures for these four industries have been combined and the ratios for the 4 and 8 largest companies have been recomputed on a basis comparable to 1963 and later years.

[38]The 1957 SIC combined two industries which were separate in the 1945 SIC: Industry 2381, Fabric Dress Gloves, and Industry 2382, Fabric Work Gloves. The 1958 value of shipments figures for these two industries have been combined and the ratios for the 4 and 8 largest companies have been recomputed on a basis comparable to 1963 and later years.

[39]A review of the reports for 1963 indicated that there were approximately 300 very small companies included in this industry which described their activities as custom drapery producers, interior decorators workrooms, etc. Approximately half of these companies were classified as non-manufacturing in the 1958 census.

[40]For 1963 and subsequent years, the value of shipments total includes shipments of logs for establishments that own and maintain timberlands but contract the cutting of logs to others. The establishments that actually performed the logging on a contract basis also reported their receipts for contract logging under the heading, "total value of shipments." Thus, an undetermined amount of duplication exists in the shipments total. The figures previously reported for 1958 and prior years do not include shipments for timberland owners that do not perform their own logging.

[41]Comparable data are not available for prior years due to a significant revision in the 1972 SIC system. This industry, as now constituted, includes wood frames for household furniture which were previously classified in industry 2512 under 1967 product class 25126.

[42]The low coverage ratio for 1963 was due to the large amount of wood chips manufactured by establishments classified in industry 2421. In 1967, wood chips were reclassified from industry 2429 to industry 2421.

[43]Comparable data are not available for prior years due to a significant revision in the 1972 SIC system. Custom cabinetwork, to be built in (1967 product class 24317) was reclassified to industry 2434.

[44]Comparable data are not available for prior years due to a major revision in the 1972 SIC system. Industry 2434 was formed by combining the manufacture of custom cabinetwork, to be built in (1967 product class 24317) with wood kitchen cabinets (1967 product class 25114).

[45]For 1972, industry 2432 was split to form new industries 2435 and 2436.

[46]This industry was revised for 1972. Historical data are not available. All products now classified in industry 2439 were formerly part of old Industry 2433, Prefabricated Wood Structures. The balance of old industry 2433 is now classified as industry 2452.

[47]Comparable data for prior years are not available due to a major revision in the 1972 SIC system. This industry was previously indentified under product class 24992 as a part of industry 2499.

[48]For 1972, industry codes 2442, 2443, and 2445 were combined to form industry 2449.

[49]Comparable data for prior years are not available due to a major revision in the 1972 SIC system. All products now classified in this industry were formerly part of industry 3791.

[50]Comparable data for prior years are not available due to a major revision in the 1972 SIC system. All products now classified in industry 2452 were formerly part of old industry 2433. The balance of old industry 2433 is now classified as 2439.

Footnotes are continued on next page.

Table 7. **Share of Value of Shipments Accounted for by the 4, 8, 20, and 50 Largest Companies in Each Manufacturing Industry: 1977 and Earlier Years**—Con.

[51]Comparable data for prior years are not available due to a major revision in the 1972 SIC system. This industry was previously indentified as product class 24993 under industry 2499.

[52]This industry was revised for 1972. Historical data are not available. This industry as now constituted excludes pallets and skids (1967 product class code 24992) and particleboard (1967 product class code 24993) which were reclassified to product classes 24480 and 24920, respectively.

[53]Comparable data for prior years are not available due to a significant revision in the 1972 SIC system. Radio, phonograph, stereo wood cabinets, and sewing machine cabinets were reclassified to new SIC industry 2517, and wood kitchen cabinets were reclassified to new SIC industry 2434.

[54]Data for 1972 are not completely comparable to earlier data due to a significant revision in the 1972 SIC system. The industry as now constituted excludes wood frames for household furniture (1967 product class 25126) which was reclassified to industry 2426.

[55]Comparable data for previous years are not available due to a significant revision in the 1972 SIC system. This industry was previously classified under industry 2511 as product class 25111 and part of product class 25112.

[56]For 1977, data may not be strictly comparable to prior years because of change in industry classification of a number of establishments between industry 2611, industry 2621, and industry 2631. These establishments are integrated operations (pulp mills and primary paper and board mills at same physical location) at which shipments of pulp are significant. Accordingly, any comparison of historical statistics should consider all three of these industries: 2611, 2621, and 2631.

[57]Beginning with 1958, integrated pulp and paper companies were given the option of reporting their pulp and paper (or board) operations on a combined basis when both were conducted at a single physical location. Most integrated companies excercise this option and file a single report covering their pulp, paper (or board) making operations at a single physical location, but a few with departmental accounting choose to report separately for the pulp mill and paper (or board) mill. The other pulp mills separately reported are: (1) those exclusively selling their pulp on the market (i.e., not associated or affiliated with a paper and board mill), and (2) those pulp mills affiliated or associated with paper or board mills but operated at a different physical location from the paper or board mill(s).

[58]This is a minimum ratio (the exact ratio is withheld to avoid disclosing figures for individual companies).

[59]This industry was revised for 1972; historical data are not available. The stationary products which now constitute industry 2648 were classified in the 1967 SIC system in industry 2649 under product class 26491.

[60]Comparable data are not available for prior years due to a significant revision in the 1972 SIC system. The industry as now constituted includes wallpaper (1967 SIC industry 2644) and excludes stationery products (1967 product class 26491).

[61]Data for 1972 are not completely comparable to earlier data due to a significant revision in the 1972 SIC system. Industry 2751 was split into two separate industries: This industry and commercial printing, gravure (industry 2754, 1967 product classes 27517 and 27518).

[62]Data for 1972 are not completely comparable to earlier data due to a significant revision in the 1972 SIC system. Industry 2752 was split into two separate industries: This industry and lighographic platemaking and related services (industry 2795, 1967 product class 27527).

[63]Comparable data for prior years are not available due to a major revision in the 1972 SIC system; this industry was previously identified as product classes 27517 and 27512 under industry 2751.

[64]Comparable data for prior years are not available due to a major revision in the 1972 SIC system; this industry was previously identified as product class 27527 under industry 2752.

[65]Comparable data for prior years are not available due to a significant revision in the 1972 SIC system. The 1972 revisions transferred the manufacture of household bleaches to industry 2842; the manufacture of synthetic ammonia, nitric acid, and ammonium compounds to industry 2873; and the manufacture of phosphoric acid to industry 2874.

[66]Government-owned establishments that are privately operated are included in this industry but did not enter into the calculation of the specialization and coverage ratios as all dollar receipts for these establishments were included in "miscellaneous receipts."

[67]Comparable data are not available for 1970 and earlier years due to a significant revision in the 1972 SIC system. The 1972 revisions transferred the manufacture of unsupported plastics film, sheets, rods, and tubes; regenerated cellulosic products, except rayon; and custom compounded purchased resins to industry 3079. In addition, the production of synthetic resin adhesives from resins manufactured in the same establishment, was transferred to industry 2981.

[68]Industry definition was revised for 1977 to include manmade fiber producers primarily engaged in the manufacture of textured fibers. These establishments were included in industry 2822 for 1972. Change represents approximately six percent of value of shipments for industry 2824.

[69]This industry was revised for 1972; historical data are not available. The 1972 revisions transferred the manufacture of household insecticides and repellants to industry 2879. In addition, the production of household liquid and dry bleaches was transferred from industry 2819 to this industry.

[70]Data for 1972 are not completely comparable to earlier data due to a significant revision in the 1972 SIC system. Caulking and sealant compounds, formerly classified in product class 28518, were reclassified into industry 2891. The degree of change based on total employment is estimated to be 4 percent.

[71]Comparable data for 1970 and earlier years are not available due to a major revision in the 1972 SIC system. This industry was formed by combining synthetic ammonia, nitric acid, and ammonium compounds (1967 product class 28191); urea (part of 1967 product class 28182); and fertilizer materials of organic origin (part of 1967 product class 28712).

[72]Comparable data for 1970 and earlier years are not available due to a major revision in the 1972 SIC system. Industry 2874 was formed by combining most of the products of old industry 2871, which includes superphosphate, other phosphatic fertilizer materials, and mixed fertilizers produced from one or more materials made in the same plant, with phosphoric acid, which was previously classified in 1967 product class 28194 as part of industry 2819.

[73]Comparable data for 1970 and earlier years are not available due to a major revision in the 1972 SIC system. The industry as now constituted includes the manufacture of household insecticides and repellants which were previously classified as product class 28421 in industry 2842.

[74]Comparable data are not available for 1970 and earlier years due to a significant revision in the 1972 SIC system. This industry as now constituted includes synthetic resin adhesives from resins manufactured in the same establishment (formerly in industry 2821); caulking compounds and sealants (formerly in industry 2851); rubber cement (formerly in industry 3069); and sealants, n.e.c. (formerly in industry 2899); and excludes gelatin and sizes (now in industry 2899).

[75]Data for 1972 are not completely comparable to earlier data due to a slight revision in the 1972 SIC system. The industry as now constituted includes gelatin, except ready-to-eat desserts (formerly classified in industry 2891); sizes (formerly in industry 2891); and embalming chemicals (formerly in industry 3994); and excludes sealants, n.e.c. (now classified in industry 2991). The degree of change, based on total employment, is estimated to be 5 percent.

[76]Includes lubricating oils and greases which are also primary to Industry 2992, Lubricating Oils and Greases.

[77]Includes lubricating oils and greases which are also primary to Industry 2911, Petroleum Refining.

[78]Data for 1972 are not directly comparable to earlier data due to a significant revision in the 1972 SIC system. Plastics footwear, which was classified in industry 3079 in 1967, is now included in industry 3021. However, the degree of change based on total employment is estimated to be 11 percent.

[79]The rubber and plastics hose and belting industry is included for the first time in the census of manufactures for 1972. The industry includes all of 1967 Product Class 30691, Rubber and Plastics Belts and Belting; and Product Class 30692, Rubber Hose and Tubing, except 30692 81, Tubing, Except Medical and Surgical and Reinforced; part of 1967 Product Class 30795, Industrial Plastics Products; and Product Class 30798, Consumer and Commercial Plastics Products, N.E.C.

[80]This industry was significantly revised for 1972. The statistics for this industry, as classified under the 1972 edition of the SIC manual, were unchanged as to code number from the previous classification, but were significantly changed in comparison with data classified by the previous system. All of 1967 Product Class 30691, Rubber and Plastics Belts and Belting and all of 1967 Product Class 30692, Rubber Hose and Tubing, except Product Code 30692 81 Tubing, Except Medical and Surgical and Reinforced, are now classified in Industry 3041, Rubber and Plastics Hose and Belting. Tubing, except medical and surgical and reinforced, is now included in product class 30695. In addition, seals and packing (formerly product codes 30695 26, 27, and 28) are now included in industry 3293; and latex and solvent-type cement (formerly product codes 30698 64 and 65) are now classified in industry 3291.

Footnotes are continued on next page.

[81]Data for 1972 are not directly comparable to earlier data due to a significant revision in the 1972 SIC system. The degree of change, based on total employment, is estimated to be 9 percent.

[82]Value of production shown for this industry in 1958 and prior years; whereas, value of shipments is shown for 1963 and later years. This change does not affect the comparability significantly.

[83]Comparable data are not available because of significant changes in the 1947 classification of plants or products in this industry.

[84]For 1972, industry 3141 was split to form new industries: 3143, 3144, and 3149.

[85]Data for 1972 are not completely comparable to earlier data due to a significant revision in the 1972 SIC system. Industrial leather belting was reclassified to Industry 3199, Leather Goods, N.E.C.

[86]Company count includes a small number of administrative records which have no apparent effect on total value of shipments or percent of value of shipments accounted for by the largest companies.

[87]The 1957 SIC combined two industries which were separate in the 1945 SIC: Industry 3192, Saddlery, Harness, and Whips, and this industry. The 1958 value of shipments figures for these two industries have been combined and the ratios for the 4 and 8 largest companies have been recomputed on a basis comparable to 1963 and 1966.

[88]Data for 1972 are not directly comparable to earlier data due to a significant revision in the 1972 SIC system. Insulation materials containing asbestos, which were previously classified in industry 3293, are now included in this industry. However, the degree of change, based on total employment, is estimated to be 4 percent.

[89]Revised percentages not available.

[90]Although the SIC number and title of industry 3293 are unchanged, the 1972 definition of this industry has been revised from that used in the 1967 SIC manual. Molded packings and seals, except plastics (formerly classified in industry 3069), axial mechanical face seals (formerly in industry 3599), plastics packing and seals (formerly in industry 3079), and leather packings, oil and grease retainers, including seals (formerly in industry 3121), are now included in this industry. Also, insulation materials containing asbestos, which were previously classified in this industry, are included in industry 3292 for 1972.

[91]Industry 3312, Blast Furnaces and Steel Mills, has been redefined since 1954 to include Industry 3311, Blast Furnaces; Industry 3312, Steelworks and Rolling Mills; Industry 2931, Beehive Coke Ovens; and Industry 2932, Byproduct Coke Ovens. For 1954 and 1947, value added by manufacture and shares accounted for by the largest 4, 8, and 20 companies have been recomputed on a basis comparable to later years.

[92]This ratio is based on shipments of primary products only by this industry. However, some of these products are also primary to one or more other industries.

[93]This industry includes, in addition to commercial (jobbing) foundries, "captive" foundries at separate locations producing gray iron castings for other plants of the same company. Accordingly, the ratios for this industry do not reflect the market shares in the commercial foundry industry as such.

[94]Comparable data are not available due to significant revisions in the 1954 classification of plants or products in this industry.

[95]Indexes not meaningful because of large miscellaneous receipts, particularly receipts for contract and commission work on materials owned by others. Such receipts are treated as primary products for this industry.

[96]A number of small establishments was misclassified into this industry. This affects the figure for the number of companies but has no appreciable effect on the total value of shipments or the percentage of value of shipments accounted for by the largest companies.

[97]The 1957 SIC combined three industries which were separate in the 1945 SIC: Industry 3422, Edge Tools; Industry 3423, Hand Tools, N.E.C.; and Industry 3424, Files. The 1958 value of shipments figures for these three industries have been combined and the ratios for the 4 and 8 largest companies have been recomputed on a basis comparable to 1963 and later years.

[98]This industry was revised for 1972; historical data are tabulated under the old definition and are not directly comparable. Warm air furnaces (old product class 34332) and parts and attachments for warm air furnaces (old product code 34336 73) are classified in Industry 3585, Refrigeration and Heating Equipment.

[99]Revisions were made to this industry for prior years to include automobile stampings plants operated by automobile producing companies. Concentration ratios cannot be published for prior years on a revised basis without approximating the operations of individual companies.

[100]Indexes not meaningful because of large miscellaneous receipts, particularly receipts for contract and commission work on materials owned by others.

[101]Comparable data are not available for 1970 and earlier years.

[102]Farm wagons, trucks, and other farm transportation equipment previously classified in Industry 3799, Transportation Equipment, N.E.C., are now included in this industry for 1972. The effect of the change on this industry is approximately 5 percent of the total value of shipments for 1972.

[103]For 1976 and prior years, data for plants primarily engaged in the manufacture of water well and blast hole drilling rigs were contained in either industry 3531 or 3533. For 1977, data for plants primarily engaged in the manufacture of these rigs were contained in industry 3533 only.

[104]Not completely comparable to 1966 and earlier years, some companies included construction receipts with value of shipments for those years. Such receipts are exluded in 1967.

[105]For 1972, the content of this industry has been slightly changed by the inclusion of automatic stacking machines and parts and attachments. The effect of this change on the industry is approximately 5 percent. These products were formerly classified in industry 3537.

[106]Data for 1977 for Industries 3546, Power Driven Handtools, and 3553, Woodworking Machinery, are not comparable to prior years. Plants primarily engaged in manufacturing chain saws were tabulated in industry 3546 in 1977; in industry 3553 in 1972. These plants had industry shipments totaling $430.8 million in 1977.

[107]Comparable data are not available for 1966 and earlier years because of significant changes in the 1967 SIC system of plants or products of this industry.

[108]Separate data cannot be published for this industry, typewriters, without revealing the operations of individual companies. Accordingly, this industry has been combined with Industry 3579, Office Machines, N.E.C., for 1972.

[109]Comparable data are not available for prior years as this industry was not separately identified prior to 1967.

[110]Ratios not meaningful because total value of primary products shipped include a significant amount of duplication.

[111]For 1972, data for coin-operated washers and dryers under 10-lb. load, and parts and attachments for these products have been moved to Industry 3633, Household Laundry Equipment. Products shifting out of this industry represent approximately 15 percent of the total shipments value at the United States level.

[112]Comparable figures not available. Ratios were calculated originally on value of shipments in 1954 and 1947. 1954 ratios for the largest 4 and 8 companies have been recalculated based on value added; 1947 ratios based on value added are not available.

[113]Industry 3716, Motor Homes Produced on Purchased Chassis, was created as a separate industry in 1977 from Industry 3713, Trucks and Bus Bodies. Data for 1977 for industry 3713 are not comparable to prior years.

[114]Not completely comparable to 1958 and later years because of a change in the SIC system. In 1958 and later years, an establishment manufacturing complete aircraft was classified in Industry 3721, Aircraft, if its value of work done on aircraft exceeded its value of shipments of any other single industry's products. In 1954 and earlier years, any establishment manufacturing at least one complete aircraft was classified in industry 3721.

[115]Value of shipments, rather than value of work done, has been used in this industry since 1970.

[116]Value of work done rather than value of shipments.

[117]Data include aircraft propellers and parts classified in industry 3723 prior to 1967.

[118]Industry 3741 is combined with industry 3742 to avoid disclosing operations of individual companies.

[119]This industry was revised for 1972; historical data are tabulated under the old definition and are not comparable. Farm wagons and other farm transportation equipment (1967 product class 37992, part) were reclassified to industry 3523. Other automobile trailers (1967 product class 37991, part) were reclassified to industry 3792; self-propelled golf carts, classified in this industry prior to 1972, were reclassified into product class 37997.

Footnotes are continued on next page.

Table 7. **Share of Value of Shipments Accounted for by the 4, 8, 20, and 50 Largest Companies in Each Manufacturing Industry: 1977 and Earlier Years**—Con.

[120] In 1967, industry 3821, Mechanical Measuring Devices, was split into three industries: 3823, Process Control Instruments; 3824, Fluid Meters and Counting Devices; and 3829, Measuring and Controlling Devices, N.E.C.

[121] This industry and 1967 Industry 3831, Optical Instruments and Lenses are not directly comparable; also, this industry is a combination of two 1967 industries: 1941, Sighting and Fire Control Equipment, and 3831, Optical Instruments and Lenses. No 1967 concentration data were published for industry 1941. However, from the final industry bulletin MC-72(2)-38A, table 1C, it can be seen that 4 percent of the total value of shipments for this industry in 1972 came from 1967 industry 1941.

[122] Data for 1972 are not directly comparable to earlier years data due to a significant revision in the industry's SIC system. Broad-tipped markers, formerly in industry 3953 (product code 39530 43), are now included in industry 3951 (product code 39510 43). However, the degree of change (based on total employment) for industry 3951 and industry 3953 are 6 percent and 8 percent, respectively.

[123] Data for 1972 are not directly comparable to earlier years data due to a minor revision in the industry SIC system. Data for embalming chemicals are now included in Industry 2899, Chemical Preparations, N.E.C.; burial garments in Industry 2389, Apparel and Accessories, N.E.C.; and innerliners, sold as such, in Industry 2399, Fabricated Textile Products, N.E.C. However, the degree of change (based on total employment) is less than 1 percent.

[124] The 1967 SIC combined into this industry six industries which were separate in the 1957 SIC: Industry 3983, Matches; 3984, Candles; 3987, Lamp Shades; 3992, Furs, Dressed and Dyed; 3995, Umbrellas, Parasols and Canes; and 3999, Miscellaneous Products, N.E.C. Concentration ratio data are not available for 1966 or prior years.

Table 8. **Share of Selected Items Accounted for by the 4 Largest Companies and Complementary Groupings Ranked on Value of Shipments for Each Industry: 1977**

Company size group	Number of--		Value of shipments (million dollars)	All employees		Production workers			Value added by manufacture (million dollars)	New capital expenditures			Cost of materials (million dollars)
